Causality assessment results of 1004 reported Serious Adverse Events Following Immunization (AEFI) cases approved by National AEFI Committee on 19th Mar 2024

The Immunization Division of Ministry of Health & Family Welfare has taken several steps to improve the National AEFI surveillance system, both the quality of investigation of cases at state level and their causality assessment at national level. Considering the importance and critical nature of the task, SOPs for causality assessment (CA) have been laid down as quality assurance. The results of causality assessment done by the CA subcommittee is discussed in the national AEFI committee meeting for final approval.

The results of the causality assessment for 1004 cases completed on **19th Mar' 2024** after thorough review, deliberation and approval by the National AEFI Committee is given in the annexure (anonymized line list of the causality assessment done by the National AEFI Committee).

564 out of 1004 cases for which Causality assessment was been done were found to have **a consistent causal association to immunization**. Of these 564 cases, 427 cases were vaccine product related reaction, 63 cases were immunization error related reaction and 74 cases were anxiety related reaction. 352 cases have inconsistent causal association to immunization (**coincidental - not linked to vaccination**), including 144 death cases. 8 cases were in indeterminate categories including one death and 80 cases were in unclassifiable category (all death cases).

Vaccine product related reactions are expected reactions that can be attributed to vaccination based on current scientific evidence. Examples of such reactions are allergic reactions and anaphylaxis, etc.

Indeterminate reactions are reactions which have occurred soon after vaccination but there is no definitive evidence in current literature or clinical trial data that this event could have been caused due to the vaccine. Further observations, analysis and studies are required.

Unclassifiable events are events which have been investigated but there is not enough evidence for assigning a diagnosis due to missing crucial information. When this relevant information becomes available, the case may be reconsidered for causality assessment.

Coincidental events are events that are reported following immunization but for which a clear cause other than vaccination is found on investigation.

Overall, the benefits of vaccination are overwhelmingly greater than the small risk of harm. However, as a measure of utmost precaution, all emerging signals of harm are being constantly tracked and reviewed periodically.

CAUSALITY ASSESSMENT CLASSIFICATION OF 1,004 AEFI CASES APPROVED BY THE NATIONAL AEFI COMMITTEE ON 19 MAR 2024

A1 - VACCINE PRODUCT RELATED REACTION
 A2 - VACCINE QUALITY DEFECT RELATED REACTION
 A3 - IMMUNIZATION ERROR RELATED REACTION
 A4 - IMMUNIZATION ANXIETY RELATED REACTION
 B1 - TEMPORAL RELATIONSHIP IS CONSISTENT BUT THERE IS INSUFFICIENT DEFINITIVE EVIDENCE FOR VACCINE CAUSING EVENT
 B2 - REVIEWING FACTORS RESULT IN CONFLICTING TRENDS OF CONSISTENCY AND INCONSISTENCY WITH CAUSAL ASSOCIATION TO IMMUNIZATION
 C - COINCIDENTAL - UNDERLYING OR EMERGING CONDITION(S), OR CONDITIONS CAUSED BY EXPOSURE TO SOMETHING OTHER THAN VACCINE
 D - UNCLASSIFIABLE
